

What is claimed is:

1. A vehicle light comprising:

a base having an open side, said base including an inner reflective surface that has a protrusion formed on a central portion thereof, said protrusion being covered with a reflective material;

a light-transmittable member attached to the open side of the base;

a circuit ring mounted to the open side of the base; and

a plurality of spaced light-emitting diodes mounted on said circuit ring;

a light beam emitted by each said light-emitting diode being incident on said protrusion to provide a convergent effect, said light beams being then reflected by said protrusion and said inner reflective surface to provide a large illumination area.

2. The vehicle light as claimed in claim 1, wherein each said light-emitting diode is a parallelepiped.

3. The vehicle light as claimed in claim 1, wherein said protrusion is oval when viewed in section.

4. The vehicle light as claimed in claim 1, wherein said light-emitting diodes emit light beams of different colors when excited.

5. The vehicle light as claimed in claim 1, wherein said inner reflective surface includes a plurality of particles provided thereon, said particles being made of a reflective material.

6. The vehicle light as claimed in claim 1, wherein the protrusion has an arcuate surface.
